SteadyStateEval Vehicle Characterization

Measured- a_y ramp-steer isolines with robust fits

Generated: 2026-05-16 11:04

Run Notes

- Open-loop ramp-steer at 12.5, 15, 17.5, and 20 m/s
- steerStart = 2.0 s; trim all pre-ramp samples
- Measured a_y is the analysis axis; commanded a_y only sets the ramp
- lmeasured a_y < 1.0 m/s² is excluded; linear band = 1.0 to 4.0 m/s²
- Understeer gradient = mean $d(\text{delta_excess})/d(a_y)$ over the linear band
- Response curves use split Hampel-filtered spline fits; sensitivities trim the outer 20% of lmeasured a_y
- steerExcess = avgSteerAngle - wheelbase * curvature
- Tire/config: MF52, baseline_v3; Backend: OpenModelica
